

PriceLabs

Integration Research & Connection Guide

STR Acquisition Market Research · May 2026
Prepared for: gene@lawhun.com

Executive Summary

PriceLabs is the most data-rich STR-native platform available for connecting to Claude for acquisition market research. It offers **four distinct connectivity paths** ranging from a purpose-built MCP server (direct Claude integration, zero code) to a full REST API. The platform covers ADR, occupancy, RevPAR, active listings, comp set analysis, demand classification, and forward-looking pricing data — exactly the layer needed for STR acquisition due diligence.

RECOMMENDED PATH

MCP Server (nicholasgriffintn/pricelabs) → direct plug-in to Claude Code. Takes ~15 minutes to configure, requires only your PriceLabs API key. No additional cost beyond your existing PriceLabs subscription.

What PriceLabs Offers for STR Acquisition Research

Tool	Data Available	Cost
STR Index	ADR, occupancy, RevPAR, active listings by country/state/region; historical + forward pacing	Free
Market Dashboards	1k–10k listing-level data within 0.1–50 km; comp sets, supply trends, demand pacing, amenity demand	\$9.99/dashboard/mo
Revenue Estimator Pro	Projected annual revenue by address + property type; seasonal breakdown	Separate sub
Revenue Estimator API	Programmatic revenue projections for any address — not just your listings	Apply for access
Customer API	Your own listings: calendars, reservations, pricing output, neighborhood rankings	Included with account
Neighborhood Data	How a specific listing ranks vs. 75th/90th percentile peers in its micro-market	Included w/ Dynamic Pricing

Connectivity Options — Detailed Breakdown

Option 1: MCP Server ★ Recommended

A pre-built Model Context Protocol server that connects PriceLabs data directly into Claude Code. Two community MCP servers exist:

A

nicholasgriffintn / pricelabs

10 tools · Pricing API · Released March 2026 · pulesemcp.com/servers/nicholasgriffintn-pricelabs

- Cleanest, most maintained option for Claude Code
- Covers core pricing, listing, and calendar data
- Requires only your standard PriceLabs API key

B

akashnambiar / pl-rm-skills

23 tools · Full Revenue Management Skill Tree · lobehub.com/ko/mcp/akashnambiar-dot-pl-rm-skills

- Layer 1 — Base Data: market-insight, reservation-insight, comp-set-data, listing-portfolio
- Layer 2 — Analytical: demand-classification, comp-set-positioning, revenue-health, seasonal-context
- Layer 3 — Strategy: orphan-gap-optimizer, los-optimizer, seasonal-pricing, last-minute-discount, comp-set-repricing, event-based-pricing
- Includes mock API server with 24 endpoints for testing without live credentials
- Skills execute bottom-up (Layer 1 → 2 → 3); each skill is self-contained with declared dependencies

Acquisition research use case: Ask Claude to pull market-insight + demand-classification for a target market, then run comp-set-positioning against candidate properties. Claude synthesizes the data into an acquisition recommendation — all in one conversation.

Option 2: PriceLabs Customer API

A versioned REST API available to all PriceLabs account holders, authenticated via API key.

Base URL	https://api.pricelabs.co/
Authentication	API key (Settings → API Details → Enable)
Documentation	Postman collection + Swagger interactive explorer
Key data	Your listings, listing calendars, reservations, pricing recommendations
Limitation	Only exposes YOUR listings — not raw market-wide comp data

Option 3: Revenue Estimator API

Returns projected revenue, ADR, and occupancy for **any address** — even unlisted properties. Purpose-built for acquisition underwriting.

Access: Apply via form at hello.pricelabs.co/revenue-estimator-api-widget/

Returns: Annual revenue projection, seasonal breakdown, comparable listing data

Widget variant: Embeddable JavaScript widget (no API calls needed for simple use)

Limitation: Requires separate approval; not instant access

Use case: Feed a target address → get projected revenue in JSON → Claude computes cap rate, CoC return, payback period

Option 4: Make.com No-Code Automation

Visual no-code workflows connecting PriceLabs to Google Sheets, Airtable, Notion, Slack, or any other app. Best for recurring market monitoring.

- Connect PriceLabs API key inside Make.com, then drag-and-drop workflows
- Pull Market Dashboard CSV → append to Google Sheets → trigger Claude analysis via webhook
- Monitor specific markets for ADR/occupancy changes → alert via Slack
- Schedule weekly STR Index pulls for target markets → build trend database

Option 5: CSV / PDF Export + Claude Upload

Every module in Market Dashboards has a CSV export button (pink icon, upper right). Full dashboards export as PDF. Zero setup — upload directly to Claude and ask questions like: *Analyze this market data and flag acquisition opportunities where RevPAR growth is >15% YoY and supply growth is <5%.*

Note: Underlying booking-level data cannot be exported.

Step-by-Step: Connect PriceLabs to Claude Code via MCP

Prerequisites: Active PriceLabs account (any paid plan) · Claude Code CLI installed · Node.js 18+

1 Step 1: Get Your PriceLabs API Key

Log into app.pricelabs.co → click your profile icon (top right) → Account Settings → API Details tab → Enable API Access → copy your API key.

2 Step 2: Install the MCP Server

Open a terminal and run:

```
npm install -g @nicholasgriffintn/pricelabs-mcp-server
```

3

Step 3: Configure in Claude Code

Open or create .claude/mcp.json in your project root (or ~/.claude/mcp.json for global):

```
{
  "mcpServers": {
    "pricelabs": {
      "command": "npx",
      "args": ["@nicholasgriffintn/pricelabs-mcp-server"],
      "env": {
        "PRICELABS_API_KEY": "your_api_key_here"
      }
    }
  }
}
```

4

Step 4: Verify the Connection

Start or restart Claude Code, then type /mcp — 'pricelabs' should appear as a connected server with its tools listed. If disconnected, check: API key has no extra spaces, Node.js is on PATH, package installed successfully.

5

Step 5: Apply for Revenue Estimator API

For address-level underwriting, visit hello.pricelabs.co/revenue-estimator-api-widget/ and request developer access. Describe your use case as 'STR acquisition underwriting'. Once approved, add PRICELABS_RE_API_KEY to your env block.

6

Step 6: Test With a Real Acquisition Query

Try this prompt in Claude Code:

Using PriceLabs, pull market insight for [target city]. Show ADR, occupancy, and RevPAR trends for 12 months, classify current demand level, and tell me if a 3BR acquisition at \$450,000 supports an 8% cash-on-cash return.

Key Limitations

Limitation	Impact	Workaround
Customer API only exposes YOUR listings	Can't pull comp market data directly via API	Use Market Dashboards + CSV export
Underlying booking data not exportable	No guest-level detail	Use aggregated ADR/occupancy from dashboards

Revenue Estimator API requires approval	Not instant access	Apply early; use Pro web UI in the meantime
Market Dashboards cost \$9.99/mo each	Budget consideration for 10+ markets	Use free STR Index for top-of-funnel screening first
MCP servers are community-maintained	May have gaps vs. official API	Supplement with direct API calls via Python tools
